- Brightens and evens eye contour, fights contrast colour

**NEW**

## ***BROWN SPOTS, LENTIGO, MELASMA... CEBELIA REINFORCED DEPIGMENTING FADES THEM AWAY***

### ***EXCLUSIVE PATENT***

In partnership with INSERM in Nice, **Doctor Ballotti** and **Professor Ortonne** went searching for a new melanogenesis regulator. The answer: **PEKALINE**.

PEKALINE disrupts melanin formation by acting on two levels:

- On the protein Kinase A, responsible for the production of the tyrosinase enzyme.
- On the pH of melanosomes, disrupting their activity.

### ***A COCKTAIL OF COMPLEMENTARY AGENTS***

**Vitamin PP** slows the transfer of melanin from melanocytes to keratinocytes, thus slowing the melanization process. **Vitamin C** reduces the color of oxidized melanin on the skin surface. And **glycolic acid** gives facial skin its radiance back, reduces pore size and uneven pigmentation.

**BROWN SPOTS, LEVITIGO, MELASMA...**  
**CEBELIA REINFORCED DEPIGMENTING TAKES THEM AWAY!**

**EXCLUSIVE PATENT**

In partnership with INEGEMA in Nice, Doctor Bédouet and Professor DROUOT were searching for a new melanogenesis regulator. The answer: **PEPALINE**.  
 • **PEPALINE** disrupts melanin formation by acting on two levels:  
 • On the growth factor A, responsible for the production of tyrosinase enzyme.  
 • On the pH of melanosomes, disrupting their activity.

**A COCKTAIL OF COMPLEMENTARY AGENTS**

Vitamin B6 stops the transfer of melanin from melanocytes to keratinocytes, thus slowing the melanization process. Vitamin C generates acid granules that skin has to remove back, reducing pore size and uneven pigmentation.
